Vertical Hierarchy Layout

Removing the side-by-side grid. We stack the Theoretical Chart physically above the Rendered Framework Map to visually trace the geometric implementation.

1. Spatial Proximity Dimensions

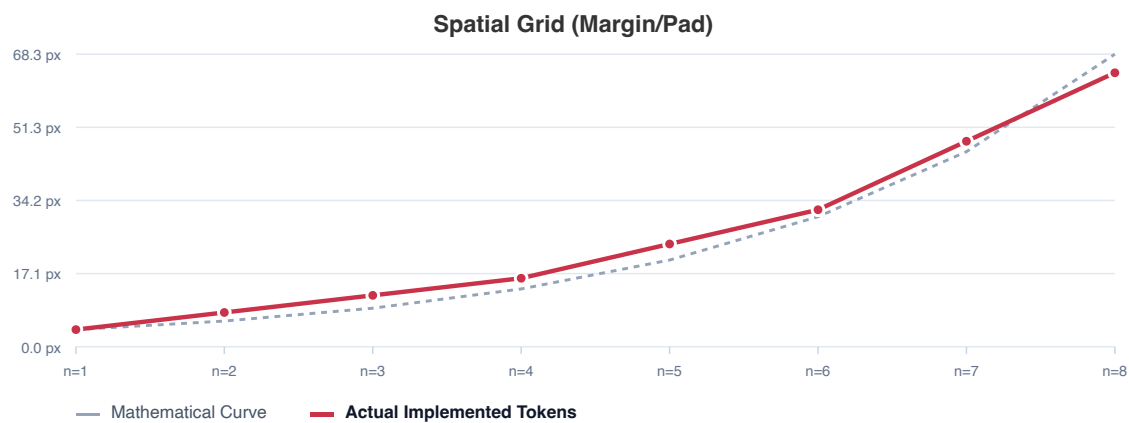

Layout geometry expands near the minimal grouping bound via an exponential step matrix.

$$S(n) = G_{min} \cdot \phi^{(n-1)}$$

where $G_{min} \approx 4$ and $\phi \approx 1.5$

Spatial Variance Analysis

Plot of actual styled output vs mathematical expectation.

Note: The actual style tags (Red) deliberately crush the pure curve (Dashed) into integer sub-pixel alignment constraints above n=5.

Manifested Spatial Tokens

space-1		4px
space-2		8px
space-3		12px
space-4		16px
space-5		24px
space-6		32px
space-7		48px
space-8		64px

2. Typographical Hierarchy Scale

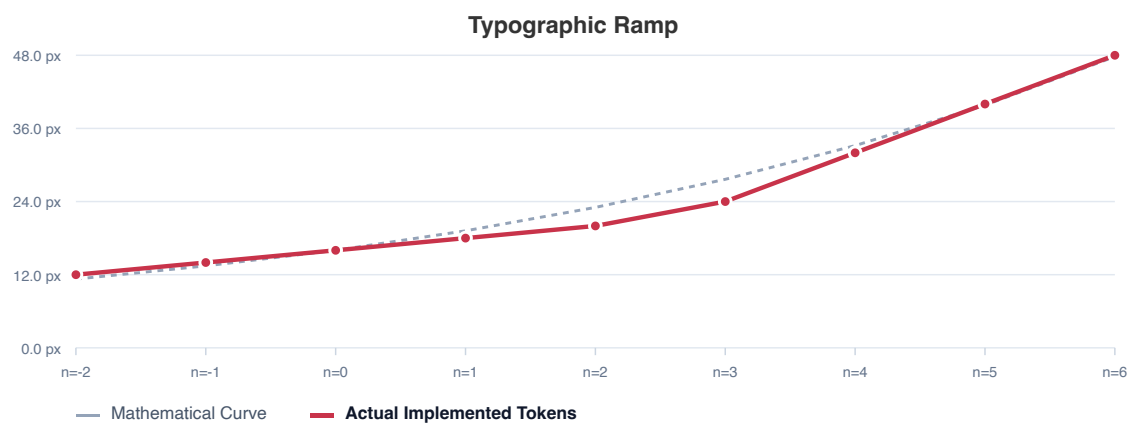

Text structures obey the standard Minor-Third optical curve. A human-factors adjustment buffers the base scale for x-height perception decay on small screens.

$$T(n) = B_{optic} \cdot (P_{ratio})^n$$

$$L_{decay}(x) = 1.2 + (1.6 - 1.2) \cdot e^{-1.5 \cdot (\frac{x - B_{optic}}{B_{optic}})}$$

Optical Ramp Analysis

Note the divergence below $n = 0$ where human-factor legibility buffering pulls away from pure math.

Manifested Type Ramps

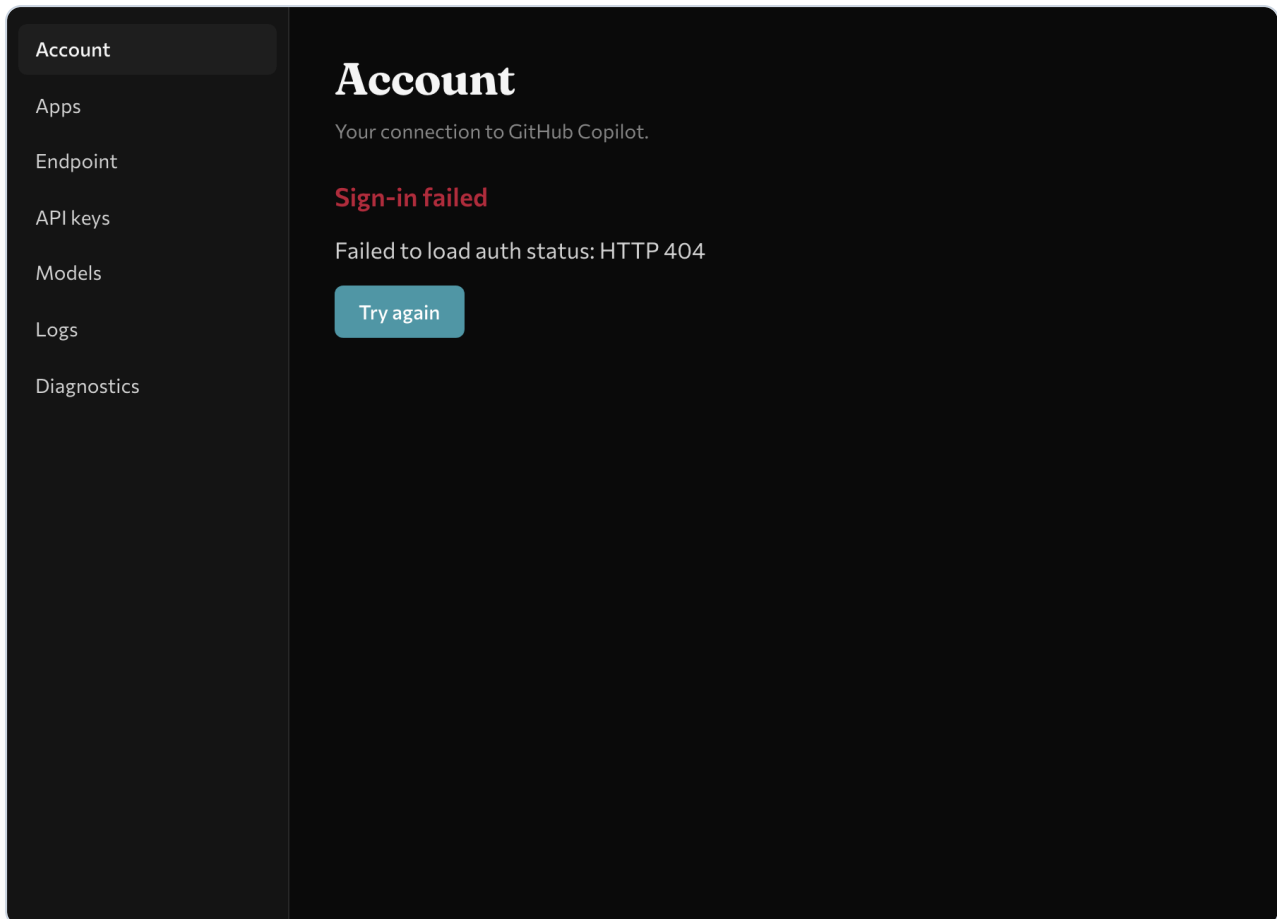

Text representation is clamped visually here so it does not destroy the page bounding box.

3. Application Surface Exhaustive Audit

We traverse all internal routes to screenshot the actual application surface executing these rules. Evaluated against known historical drift areas.

Surface: `#account`

Logs

Daily-rotated request and handler logs, 7-day retention.

Where logs live

Each handler writes a per-day file under the maximal state directory. Reveal the folder to inspect them, or tail the active file with `tail -F`.

macOS / Linux	<code>~/.local/share/maximal/logs/</code>
Windows	<code>%USERPROFILE%\local\share\maximal\logs\</code>
Retention	7 days, then deleted on next boot
